ABSTRACT:

A real time information manager which processes raw data from data providers, such as

feeds of current information about financial product offerings, is provided. Raw data objects

received from various data providers are analyzed, formatted, and a current version of each

5   unique data object is stored in an object storage pool. Information about the state of each objects

is transmitted on a particular output data channel in accordance with the type of object. A

subscriber process can access one or more of the data channels and utilize the broadcast data. In

one configuration, one or more client managers are provided which subscribe to particular data

channels and serve as an intermediary between the real time information manager and sets of

10   clients.
